# National Monitoring System for the Sustainable Development of Palm Oil in Guatemala

Results of the study: **Satellite monitoring for the sustainable development of palm oil production in Guatemala** carried out by Satelligence based on time-based analysis of satellite images from optical and radar sensors in the period 1989-2020. Analysis of 37,770 km2 of Guatemalan territory, covering areas of operation of the palm oil agribusiness and surroundings.

# Distribution of oil palm by Department

Source: Satelligence, 2021.

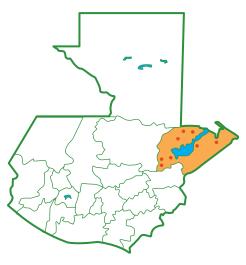

According to data from the 2019-2020 National Agricultural Survey produced by the National Statistics Institute of Guatemala (INE, 2020), the area used or with potential for agricultural production at country level is 7,354,100 hectares, which means that the cultivation of oil palm in Guatemala represents 2.46% of the total arable area nationwide.

## Oil palm crops in Guatemala

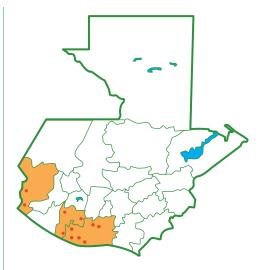

#### Petén

The oil palm crop represents only **7%** of the agricultural land of the department.

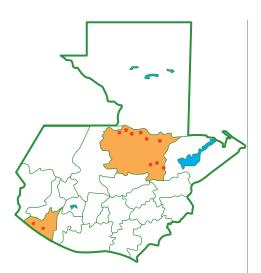

#### Izabal

The oil palm crop represents **10%** of the agricultural land of the department.

### **Escuintla, San Marcos** and Suchitepéquez

The oil palm crop represents **3%** of the agricultural land of each one of these departments.

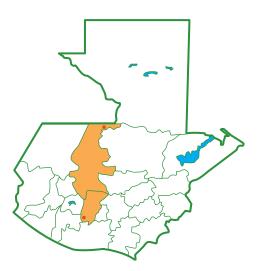

#### Alta Verapaz and Retalhuleu

The oil palm crop represents **4%** of the agricultural land of the department of Alta Verapaz and **5%** of the agricultural land of the department of Retalhuleu.

#### Quetzaltenango

The oil palm crop represents **7%** of the agricultural land of the department.

#### **Quiché and Chimaltenango**

The oil palm crop represents 1% of the agricultural land of the department de Quiché y el **0.14**% of the agricultural land of the department of Chimaltenango.

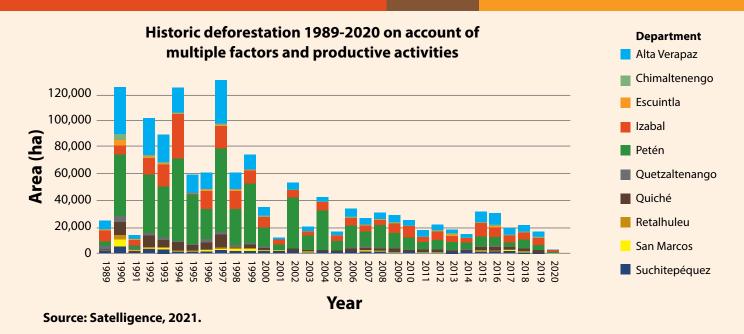

#### Historic deforestation in the study area

Historic deforestation refers to areas that have been deforested by multiple factors and productive activities between 1989 and 2020, specifically in the 37,770 km2 of the study area monitored by Satelligence. This study area covers departments with the oil palm crop.

#### Total of 1,407,138 hectares lost

to multiple factors and productive activities.

# Oil palm associated to deforestation

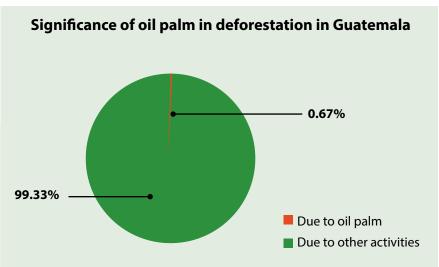

According to the satellite images for the period 1989-2020 performed by Satelligence, 180,614 hectares of oil palm are planted in Guatemala, of which 16,479 hectares are associated to deforestation.

More than

of the oil palm in Guatemala

is planted in low-carbon areas, different from primary forests.

According to the Forest Information System of Guatemala, between 1989-2020 around 2,455,617 hectares of forest were lost at country level, so it is estimated that the cultivation of oil palm represents 0.67% of total deforestation in the country.

The National Monitoring System for the Sustainable Development of Palm Oil in Guatemala monitors the **VOLUNTARY COMMITMENT TO ZERO DEFORESTATION** adopted by the Guatemalan palm oil sector.

# Actions underway as part of the commitment by the palm-grower sector:

Permanent monitoring of oil palm plantations to ensure a supply chain free from deforestation.

Establishment of a Zero
Deforestation Cross-Agency
Working Group with public and
private players, academia and
international organizations to
monitor and give continuity to
acquired commitments.

Promotion of environmental conservation and restoration projects and initiatives.

"Environmental conservation is a pillar of Guatemalan palm oil production"
